

# Roadmap to a carbon positive future by 2030

As a responsible business we need to play our part in the global effort to combat climate change.

We plan to go beyond achieving net zero carbon emissions, becoming a carbon positive business by **2030** – 20 years ahead of the UK government’s net zero carbon target.

Our business is embedded in local communities which means our roadmap to a carbon positive future will involve working with our colleagues, suppliers, community partners and commissioners to achieve this important goal.

### Our commitments:

Colleagues will be supported to reduce carbon output at work and home

Residual carbon will be offset

Suppliers will be encouraged to be carbon neutral

Natural gas use will be reduced

Vehicle fleet will be electric

Business commuting will be offset

Energy will be purchased from sustainable sources

Single use plastics will be eliminated from operational business use

Waste will be segmented to minimise landfill

We plan to reduce the carbon output from our business by all possible means. For any areas where this is not possible we commit to offset our carbon output. We are exploring innovative, sustainable and credible ways of doing this to benefit our local communities and the environment.
